Reading

GPS

1- You might think you're an expert at navigating through city traffic, smartphone at your side. You might even hike with a GPS device to find your way through the backcountry. But you'd probably still be surprised at all the things that GPS—the global positioning system that underlies all of modern navigation—can do.

2- GPS consists of a constellation of satellites that send signals to Earth's surface. A basic GPS receiver, like the one in your smartphone, determines where you are—to within about 1 to 10 meters—by measuring the arrival time of signals from four or more satellites. With fancier (and more expensive) GPS receivers, scientists can pinpoint their locations down to centimeters or even millimeters. Using that fine-grained information, along with new ways to analyze the signals, researchers are discovering that GPS can tell them far more about the planet than they originally thought it could.

3- Over the last decade, faster and more accurate GPS devices have allowed scientists to **illuminate** how the ground moves during big earthquakes. GPS has led to better warning systems for natural disasters such as flash floods and volcanic eruptions. And researchers have even MacGyvered some GPS receivers into acting as snow sensors, tide gauges and other unexpected tools for measuring Earth.

4- And scientists have even been able to study the effects of a total solar eclipse using GPS. In August 2017, they used GPS stations across the United States to measure how the number of electrons in the upper atmosphere dropped as the moon's shadow moved across the continent, dimming the light that otherwise created electrons. So GPS is useful for everything from ground shaking beneath your feet to snow falling from the sky. Not bad for something that was just supposed to help you find your way across town.

The most dangerous animal

1 When we are young, we learn that tigers and sharks are dangerous animals. We might be scared of them because they are big and powerful. As we get older, however, we learn that sometimes the most dangerous animals are also the smallest animals. In fact, the animal that kills the most people every year is one that you have probably killed yourself many times: the mosquito.

2 While it may seem that all mosquitoes are biters, this is not actually the case. Male mosquitoes eat plant nectar. On the other hand, female mosquitoes feed on animal blood. They need this blood to live and produce eggs. When a female mosquito bites a human being, it transmits a small amount of saliva into the blood. This saliva may or may not **contain** a deadly disease. The result of the bite can be as minor as an itchy bump or as serious as death.

3 Because a mosquito can bite many people in the course of its life, it can carry diseases from one person to another very easily. Two of the most deadly diseases carried by mosquitoes are malaria and yellow fever. More than 700 million people become sick from these diseases every year. At least 2 million of these people will die from these diseases.

4 Many scientists are working on safer and better ways to kill mosquitoes, but so far, there is no sure way to protect everyone in the world from their deadly bites. Mosquito nets can be placed over beds to protect people against being bitten. These nets help people stay safe at night, but they do not kill any mosquitoes. Mosquitoes have many natural enemies like bats, birds, dragonflies, and certain kinds of fish. Bringing more of these animals into places where mosquitoes live might help to cut down the amount of mosquitoes in that area. This is a natural solution, but it does not always work very well. Mosquitoes can also be killed with poisons or sprays. Even though these sprays kill mosquitoes, they may also harm other plants or animals.

5 Although mosquitoes may not seem as scary as larger, more powerful animals, they are far more dangerous to human beings. But things are changing. It is highly likely that one day scientists will find a way to keep everyone safe from mosquitoes and the diseases they carry.

11. What is the above text MAINLY about?

- A. convincing people that animals are dangerous
- B. asking people to take precautions when dealing with animals
