

Today world seeks eagerly for the clean sources of energy due to the serious human's activities that caused dangerous problems for the environment, plants and animals. Pollution becomes everywhere. Therefore all the countries search dealing with safe sources of energy as wind, solar and hydroelectricity. These infinite resources form a great advantage for humanity. In the meantime, there are too cheap in comparison with the traditional resources which cause air, water and soil pollution, producing greenhouse gases that contribute to global warming. Solar energy is our most powerful source of energy that can be used in several uses as lighting and cooling homes, generating electricity, water heating and a variety of industrial processes. It may be the time to consider solar energy as a home energy saving strategy. It is a good time now to go solar with the advancements in technology of the solar industry; prices for solar panels become affordable. It may be worth that a group of families shared together to purchase a solar energy project to reduce the bills of electricity.

Wind energy is a one of the useful and practical resources as it is the movement of air that occurs when warm air rises and cooler air rushes in to replace it. It is used for centuries to sail ships and drive windmills that grind grain. Today it is captured by wind turbines and used to generate electricity. United States of America is one of the greatest and fastest growing - wind markets in the world. American Energy Department always stays competitive in this field to advance technology, create job opportunities and boost economic growth. All the countries go to use the renewable energy for cleanness and cheapness. Renewable resources always keep the environment safe and quiet. Really renewable resources are the gift from God and we should save them to the next generations.
